## SUN FLOWER

### MONSOON SEASON IS HERE!.....

As the monsoon arrives in India in June, it's a best month to enjoy the wet weather and monsoon festival in India. The monsoon season is the rain season for us here in india.

Generally the monsoon festivals fall during the holy month of Shraavan, during this there are plenty of fairs and festivals that celebrated with dancing, singing and feasting welcome the rains.

Although it is beautiful and greatly needed, it can sometimes wreak havoc on your landscaping. This is the unfortunate happening of heavy rains and wind.

It can greatly affect newly installed landscaping as well as mature and established trees. There are precautions that can be taken to eliminate or to help minimize damage done by the Monsoons.

Make sure that trees are secure with the stakes and if needed, add a second or third stake for stabilization.

Just be sure to not stake too tightly. If you do have mature trees, thinning a top heavy tree will help to balance the weight and help to prevent a tree from snapping or toppling over.

High winds and dust storms may move or clog the emitters in your drip line. Once the storm has passed, it's always a good idea to go around and check that they haven't blown out of place or been clogged by debris.

Monsoons are an act of “Mother Nature” and the damage caused by them is not under warranty. However, precautions can be made to help your landscape survive the monsoon season.

## Featured Design :

This project was done in ECR, Chennai For Mrs. Geetha's residence. This project's Highlight was an infinity edge pool also named vanishing edge pool is a swimming pool that produces a visual effect of water extending to the horizon, to “infinity.”

Although many of the plants and stones used for inspiration and we were able to successfully bring the “look”.

## Reader's question:

Q.

My Grass was installed this week and there are sections that are quite yellow. Why is this happening and what can I do about it?

A.

When new sod is installed, it may need a period of transition. We have found that after it is initially installed there are some key elements that have to happen in order for it to green up again. The first is that it must be put on a continuous appropriate watering system. Initially it will need more water for establishment and rooting. Early morning watering is the best and prevents evaporation and burn to the sod. Also if possible, try to eliminate any foot or animal traffic on the sod until it has rooted. There are some fertilizers containing nitrogen that can help to green the sod after it becomes established. (You want to follow directions precisely in order for it not to burn your sod.) Finally, mowing the sod frequently after it has been completely rooted can also help prevent the brown “canopies” of thick Bermuda that can build up. These proactive measures should help your sod recover quickly and you should start to be able to enjoy a green lawn.
